Liver Metastases of a Sigmoid Cancer

Remission of Liver Metastases of a Sigmoid Cancer through the Immunobiological Issels Treatment without further Standard Treatment

Patient A.O., Born 1923, File 406/67

10 years cancer free without any recurrence, patient leading a normal life, fully fit for work.

TREATMENT HISTORY

First Diagnosis

April 1967

Diagnosis: Carcinoma of the sigmoid with liver metastases.

Histology: Ulcerated Adenocarcinoma.

Treatment: Ileus-operation. Sigmoid tumor and liver metastases are not removed.

Standard/ Conventional Treatment

May 1967

Treatment: Resection of the sigmoid tumor of 6 cm diameter. Liver metastases are not resected.

Biopsy of liver metastases at laparotomy and resection confirms malignancy as above.

No Standard Treatment.

Issels Treatment

June to August 1967

Issels Treatment: 7 weeks immunobiological in-patient treatment and several months of out-patient follow-up treatment.

Remission. No recurrence.

Follow-up until 1971

Issels Immuno-Oncology
